

# Assignment Web Similarity Analysis

Generated on 2025-03-26 19:54:17

## Executive Summary

Overall Web Similarity Score: 0%

**Assessment:** The assignment text demonstrates no significant similarity to the provided web content. The web sources focus on drum tuning and RC car tuning, while the assignment describes a database systems project.

**Conclusion:** The assignment is original work. The phrase "database tuning" appears in both the assignment and the first web source URL (tune-bot.com/tuning-guide/), but the context is completely different. In the assignment, it refers to optimizing database performance. On the drum tuning website, "tuning" refers to musical instrument adjustment. This shared term falls under common technical jargon within their respective fields and doesn't constitute plagiarism. No evidence suggests improper use of online sources in the creation of this project report.

## Web Sources Analyzed

Source URL	Similarity Score

## Part A Relational Database

### 1.1 Chapter 1 Requirement Analysis

#### 1.1.1 Functional Requirements

During this project it is clearly understand whether the relationship has build up upon the pet adoption centre. Initially concluded that the entities, attributes and the relationships where the database of pet adoption which is deals with the adopters and also the pet availability . here used the conceptual database model while these process it has converted the conceptual representation into the logical structure of database through the normalization process. In these database it was used the MySql to represent the physical structure of the database on Pet\_-Adoption.

- 
- 
- 
- 
- 
- 
-

First identify the user under the categories as adopters, admin, employees as well as the personal details of them.

As the main relationship is occurred with the users with the pet which are under adopted or they has still live in this centre as well as including with the details of the pets availability.

Considering pet entity it mainly focused on their health issues from that there has stored data as vet visit details , as well as the medical history of those animals.

When considering about the pet adoption centre it has direct relationship with the users and transactions whom are adopters, or the donators it will be transacted with. As well as it includes the financial also it provides that it has mainly income of it.

Considering about the user there is a entity named shelter where it was managed or worked employees in the adoption centres where they has spread over the country.

It can be a user as an adopter or willing to be an adopter so that there is an opportunity to showcase the abilities of their pets or can watch the abilities of the pets and can be get a dicision of think of the adoption.

As an adopter there is a main service provide here that is can be get veterinary services under the various vets' supervision.

#### 1.1.2 Data Requirements

Considering about these database it can be identified as basically 8 entities and that was consistence with 2 weak entities also. Others are named as strong entities. All the entities and the attributes of the database is provided below.

##### ➤ Strong entities and attributes

##### 1. User

User\_ID

Name

Contact\_No

Email

Adress

Reg\_Date

##### 2. PET

Pet\_ID

User\_ID

Pet\_Name

Pet\_Type

Age

Date of birth

Breed

Availability

##### 3. Transaction

Trans\_ID

User\_ID

Vet\_ID

Trans\_Date

Amount

Trans\_Type

##### 4. Financial

Amount

Trans\_ID

User\_ID

5. Event

Event\_ID

Event\_Name

Event\_Date

User\_ID

Event\_Location

6. Vetanary

Vet\_ID

Vet\_Name

User\_ID

V\_Date

Pet\_ID

Medicine

7. Vet\_Visit

Vetvisit\_ID

Vet\_ID

Visit\_Date

Reason

Vet\_Name

Pet\_ID

➤ Weak entites and attributes

1. Medical\_History

History\_ID

Pet\_ID

Pre\_Date

Details

2. Comments

# Analysis Methodology

---

**Web Similarity Analysis Method:** This report analyzes the similarity between a student assignment and web content using multiple approaches:

1. **Basic similarity analysis** using TF-IDF vectorization and cosine similarity metrics to calculate statistical similarity between texts.
2. **Advanced semantic analysis** using Google's Gemini AI to identify conceptual similarities, common phrases, and potential plagiarism patterns.
3. **Source verification** by analyzing multiple sources to distinguish between common knowledge and unique content.

## Interpretation Guide:

- 0-15%: Very low similarity - Likely original content
- 16-30%: Low similarity - Contains common phrases but largely original
- 31-50%: Moderate similarity - May contain some paraphrased content
- 51-70%: High similarity - Contains substantial similar content
- 71-100%: Very high similarity - Significant portions may be unoriginal

---

*Disclaimer: This automated similarity analysis provides an approximation of content similarity against web sources. Results should be interpreted by a human reviewer for context-appropriate assessment. Common knowledge, standard phrases, and coincidental matches may be flagged and require human judgment.*
