Assignment Web Similarity Analysis

Generated on 2025-03-26 05:02:08

Executive Summary

Overall Web Similarity Score: 10%

Assessment: Low overall similarity. The assignment primarily contains code, equations, and figure references related to control systems, which are unlikely to have direct textual matches on the web. The identified similarity is primarily due to common phrases and technical terms inherent in the subject matter.

Conclusion: The assignment shows no evidence of plagiarism. The use of standard technical terminology like "Root Locus", "transfer function", and "natural frequency" and code snippets within the context of a control systems design assignment does not constitute plagiarism. The MATLAB/Simulink code presented is specific to the problem described in the assignment and not generic code easily found online. The assignment's structure and content suggest original work applied to a control systems problem. The provided web source (a PDF from MIT OpenCourseware) is not relevant to the specific content of the student's work. The PDF appears to be a raw, unrendered document, not showing actual content that could be compared.

Question2)

Figure 4: Code for Root locus of closed loop

Figure 5: Root Locus

Source: None

By considering the characteristic equation

2 =

= 10.045

```
clc; clear; close all;
%% Define the Open-Loop Transfer Function for DC Motor Position Control
numerator = [0.042]; % System gain
denominator = [17.556e-5, 1.764e-3, 0.042]; % Denominator coefficients
G = tf(numerator, denominator);
%% Plot the Root Locus of the Open-Loop System
```

Source: None

```
figure;
rlocus(G);
title('Root Locus of DC Motor Position Control System');
```

Source: None

```
grid on;
%% Increase Natural Frequency by 10%
omega_n = 10.045; % Current natural frequency (example value)
```

Source: None

omega_n_new = 1.1 * omega_n; % New desired natural frequency (increase by 10%)

Source: None

% Now, we will modify the system to achieve the new natural frequency.

Source: None

% We need to adjust the parameters of the system such that the new ωn is achieved.

% Adjust the denominator to increase ωn by 10%

denominator_new = denominator;

denominator_new(1) = denominator_new(1) * (omega_n_new / omega_n); % Adjust the first denominator term to scale with ωn

% Create the new transfer function

Source: None

G_new = tf(numerator, denominator_new);

%% Plot the Root Locus of the Modified System

Analysis Methodology

Web Similarity Analysis Method: This report analyzes the similarity between a student assignment and web content using multiple approaches:

1. **Basic similarity analysis** using TF-IDF vectorization and cosine similarity metrics to calculate statistical similarity between texts.

2. **Advanced semantic analysis** using Google's Gemini AI to identify conceptual similarities, common phrases, and potential plagiarism patterns.

3. **Source verification** by analyzing multiple sources to distinguish between common knowledge and unique content.

Interpretation Guide:

• 0-15%: Very low similarity - Likely original content

• 16-30%: Low similarity - Contains common phrases but largely original

• 31-50%: Moderate similarity - May contain some paraphrased content

• 51-70%: High similarity - Contains substantial similar content

• 71-100%: Very high similarity - Significant portions may be unoriginal

---

Disclaimer: This automated similarity analysis provides an approximation of content similarity against web sources. Results should be interpreted by a human reviewer for context-appropriate assessment. Common knowledge, standard phrases, and coincidental matches may be flagged and require human judgment.
